the major methodological task for modern economists has been to establish the testability of models too often however methodological assumptions can make a model virtually impossible to test even under ideal conditions yet few theorists have examined the requirements and problems of assuring testability in economics in the methodology of economic model building first published in 1989 lawrence boland presents the results of a research project that spanned more than twenty years he examines how economists have applied the philosophy of karl popper relating methodological debates about falsifiability to wider discussions about the truth status of models in natural and social sciences he concludes that model building in economics reflects more the methodological prescriptions of the economist paul samuelson than popper s falsificationism this title will prove invaluable to both students and researchers and represents a substantial contribution to debates about the scientific status of economics

this book provides accounting students in post secondary institutions with an advanced level understanding of how to use ms excel to make business decisions it reflects real life applications of this important analytical tool which has become the accepted industry standard for spreadsheet software

this book is a practical guide to building economic models both macroeconomic and multisectoral it uses free software available from the internet together with regularly updated databanks including the quarterly national accounts of the united states and other quarterly data it assumes no prior acquaintance with econometrics or computer programming but does assume a willingness to follow a mathematical argument much of the text has often been used in college teaching the book begins with a very simple model that can be computed with a hand calculator or cell phone the model has however a nonlinearity in the investment function and shows how a nonlinearity can lead to a model with a cycle which neither damps out nor explodes it then moves to models built with real data in the framework of the u s national income and product accounts and develops the important concept of identity centered modeling once the identities are working properly the modeler can proceed to the estimation of equations by least squares regressions gradually the reader is led to the construction of a model roughly comparable to those used by commercial economic forecasting firms at every step of the way the reader sees results of calculations with real data and is urged to estimate his or her own equations with real up to date data the second section explores making alternative forecasts with this model and devising optimal economic policies with its aid it also explores the range of uncertainty of the forecasts due to known variability of the errors in its equations a rather long chapter expounds some conventional econometric methods and applies them to real data to both illustrate them and evaluate their usefulness although most of the book uses equations which are linear in the parameters which must be estimated some functions very useful for certain purposes in economics are non linear in the parameters a chapter is devoted to their estimation most of the book uses the relatively simple u s system of national accounts but one chapter deals with modeling with the more complicated system of national accounts used by most other countries like the economy itself dynamic models such as those built here have a tendency to develop cycles one chapter looks into the mathematical theory of why that is so the third section enlarges the scope of the book to include multisectoral models although here the model actually built is a tiny one of 8 sectors with made up data the methods employed are exactly those of the inforum models used in a number of countries around the world multi sectoral models can use many of the same techniques used for macromodels but there are some additional problems one of these is the estimation of personal consumption functions where the demand for any one product depends not only on

its price but those of all other products one method which has worked better than others is explained and the results of its estimation in four countries are presented and compared another problem is the computation of product to product tables from those constructed by statistical agencies the book does not explain real business cycle models nor computable general equilibrium models nor dynamic stochastic general equilibrium models which are all in the author s opinion unrealistic fads not serious ways of modeling an economy

begins with a literature review on community economic development in general and on forestry dependent communities the literature is reviewed in the following terms the financial market traditional and non traditional strategies for development resource dependent communities and government roles and policies in economic development the review is organised into topics including the role of entrepreneurship urban community development in canada and local industrial development the next sections examine selected measures of sustainable forestry and community development and factors involved in northern ontario community development finally an input output analytic model is presented for assessing impact on a community of expenditures on investment projects and other activities at the local and provincial level the analysis is illustrated for a hypothetical case where the output of pulp and paper operations in kapuskasing ontario is valued at 150 million economic impact results are supplemented by discussion of some general socio economic indicators produced by the model

contains papers that appeal to a broad and global readership in all fields of economics
